Dr David Martin Exposes The Entire Plandemic

https://t.me/DrDavidMartin/22

I'm the developer of linguistic genomics which was the first platform on which you could determine the intent of communication rather than the literal artifact of communication. But we've also used that technology for a number of other applications in defense and intelligence and finance. And most notably in the early 2000s, my company was responsible for bringing down what was at the time one of the largest tax frauds in US history. We maintained a series of inquiries into every individual, every organization and every company that is involved in anything that either blurs the line of biological and chemical weapons or crosses that line in any of 168 countries. In 1999 there were a million patents digitized by IBM and those million patents were the first time human innovation had been put into an electronic digital searchable format. We took that information and we did a very simple exercise using our linguistic genomics technology. I made the horrific assessment that approximately one third of all patents filed in the United States were functional forgeries, meaning that while they had linguistic variations, they actually covered the same subject matter. In 1999, patents on coronavirus started showing up and thus began the rabbit trail. -- People -- In 1999 patents on coronavirus started showing up and thus began the rabbit trail. People don't do their own research. One of my researchers said, have you seen anything from David martin? It kind of went over my head and he said, give it another try. He said he's brilliant. This guy has been keeping Track of the paper trail since the late 80s, -- literally he's got -- Track of the paper trail since the late 80s, literally. -- He's got -- Track of the paper trail since the late 80's literally he's got -- the valid -- the valid proof on all of this stuff we're talking about. Let's go do a deep dive. We did a deep dive on every claim. We called, everyone that might know him. Every story he told checked out. And then somebody called him and they said, you know, your film crew is is vetting you right now and he goes, good, they should. When you are in fact coercing a population, you increase the frequency and the amplitude of the lie so that the public doesn't have time to think. You take a thing that does exist. You amplify its harm to humans. That's a weapon. So this is not a planned emmick. It is a criminal conspiracy to harm maim and kill humans. That's what it is. Because we knew that sometimes standing for something was better than kneeling for everything. Okay, everybody welcome to this week's episode of the One Shop Movement podcast. We dive deep into the stories of entrepreneurs, business people, anyone that's out there making it happen. And we were running a very special series at the moment called Navigating the fog to thrive on the other side. And we have arguably one of them the planet. His name is Dr David Martin. And you would have heard my interview recently with Mikki Willis who created probably the content that has saved humanity at the speed that it got out to a billion people so quickly. And that content was made really debunked 100% debunked because of David Martin and his incredible history in in this whole pandemic, let's call it. It is what it is. So welcome to the show. David. Great, great to be here. It's an honor to be with you and an honor to be part of the story. Great. And I always like to invite the guests to share a bit of their background and story. And for you, your story is um, I guess you've put the puzzle together. You're like the person that's been in in the rabbit hole of content for probably three decades. So just share a bit about your background. We're going to dive more into what you've discovered along the way. But how have you got to this position today in the whole story? Well, beginning in the late 80s, I was involved in trying to understand what was going on with government corruption. Some of your listeners will remember a period of time when Iran contra was words that we used to talk

about when what the government was saying he was doing and what it was actually doing weren't matching. And so I was actually in Costa rica on the Nicaraguan border. Um, revealing a lot of things that weren't supposed to be revealed then. So I have a long tradition of doing this is the bottom line In the decade of the 90s. I was running treaty restricted technology transfer. What that means is that we were going into countries that for reasons largely around the end of the Second World War, they were prohibited from exporting military technologies. My job was to go into a lot of those countries, find civilian ways to take that technology out and then find commercial applications for it. So I did a decade of what I would, you know, if you want to, if you want a nice fantasy picture of it, it's the the Q lab in a James bond movie. I was going into these really cool defense facilities around the world and finding cool stuff that we could bring back out. So if you use a cell phone, if you use a computer, if you have a diagnostic procedure that uses anything in radiography, the likelihood is very high that you've benefited from at least one or more of my fingerprints. But What happened in the late 90's is I was asked to build a system that would allow us to use intangible assets, patents, copyrights, trademarks, those kinds of things to help make small businesses able to access banking capital, which had never been done before. Um that's the platform I built. And unfortunately that's how all this started. Because when I started looking at the patent records in 1998, 1st digital records of patents, I started seeing violations of biological and chemical weapons laws and treaties that attracted my attention and And the rest is history. So coronavirus and I have been on a very bizarre journey since 1999 and here we are today. And it is very much like um we're going to talk about pandemic in a bit. But we we do want to move into solutions and that which you're really actively involved in at the moment. But I guess yeah with this is very much like, you know the big big massive spider web and You know like a Swiss watch has got 150 different parts to make it work. You know, so many different variables to this in regards to planned emmick. What did you put together in that documentary that really embedded down the corruption and everything that really what we're living in? Absolutely. So the bottom line is that coronavirus for many decades was known to be a veterinary concern and it largely was directed at pigs at dogs and a couple other, you know, vertebrate animals. And the disease that it caused was what was called gastroenteritis. In other words, animals had very significant gastric problems, Many of them died in infancy. So it's a real problem for veterinarians. But in 1990 eight and 1999 Anthony Fauci at N. I A I. D. Started working with a guy who figured out how to manipulate coronavirus and make it target cardiac tissue. He started with a rabbit model, cardiac myopathy and rabbits. And he spent 10 years perfecting ways to change the coronavirus model. So they could target heart tissue. And then the idea came, Hey, hold on a minute. We could use this manipulation of coronavirus to make a vaccine vector. So in 1999-2002, he paid for the University of North Carolina Chapel Hill to make what they called an infectious replication defective. And let's pause, infectious means it just makes you sicker, replication defective means you get sick, but you don't necessarily spread it to your neighbors. So infectious replication coronavirus. They patented it in 2002 And the World First had SARS in 2003. Now listen, I'm not saying that they made SARS, but I am saying that they made a coronavirus that never in its history had ever infected human lung epithelium and cardiac endothelial cells. And mysteriously after they patented it. Somehow or another. It happened. You draw your own conclusions because that's all you need to know because by 2003 when SARS came out the Center for Disease Control and Prevention which lives under the umbrella of the National Institutes of Health. That organization patented SARS and patented the whole genome of SARS. So this thing has been a commercial enterprise Since 2002 at University of North Carolina Chapel Hill. Since 2003 at the CDC.

And the whole time, the whole massive racket has been funded and coordinated by none other than Anthony Fauci at the National Institute for Allergy infectious disease. So this is not a planned emmick. It is a criminal conspiracy to harm maim and kill humans. That's what it is. Mm Hmm. And yeah, look, I mean, I always say to people, you know, this is not up for debate anymore. That's a 20 April and April 2020 conversation because they write it in their books at the World Economic Forum. They've got it all over their website. They are telling us. And If I was to break it down in 60 seconds for the everyday average layperson to say, here's the evidence. Here's the facts. What would you say the two or three bits of information that you would just say? Well in 2013 this happened. What would be the three things that maybe help people understand? So there you go. 2013, Wuhan Institute of Virology Virus one was invented in China. It was replicated in 2014 at the University of North Carolina Chapel Hill in violation of the main the moratorium on gain of function research in 2000 and 15 peter dash and I'm quoting said we need to have the public accept a pan coronavirus vaccine. We need the media to create the hype to get to the real issues. We need to use that hype to our advantage investors will follow if they see profit at the end of the process. That is a quote. If anybody thinks this is about public health. If anybody thinks that dan andrews or any of the crazies across Australia or if anybody thinks that any of the Department of Health and human services here in the United States or anybody in the UK or anywhere else. If they think this is about an illness or public health, they need to read what the criminals said. This was about creating media hype To get the public to be coerced to take something that they would not otherwise take. And it is because and they said it very clearly in 2016, it was because the public was resistant of taking an influenza vaccine that they wanted everybody to be addicted to. But the public didn't fall for it because it didn't work. That's why the public didn't fall for it. Now. We're living in a period of time where they've told us they're doing this In 2019, September 2019. They said that by September 2020, the world had to conduct a global exercise in the release of a respiratory pathogen so that the world would accept a universal vaccine that was stated three months before there was allegedly a sniffle in Wuhan china. So listen, you can either try to fit their story into a collusion, nonsensical illusion or you can accept the fact and the fact is they admitted to the crime and they are now conducting that crime and their crimes are now costing people their life and their livelihood and we must do all we can to stop that. Mm hmm. Yeah. And you mentioned um that and I hear you often say, let's not refer to this as a virus. And you know, a coronavirus as it is. You say this is a bioweapon. Um, do you want to explain what that actually is to people? Because that's a confronting word. Yeah. Well listen, it unfortunately defined in the law, not only here in the United States but also in Australia. So there you go. We've got the law both places. If you make a device designed from nature, but you crime eric lee or rick competently alter that thing to make it more deadly to humans. That's the definition in the statutes of what a bioweapon is. And so I'm not making an allegation. I'm merely stating that their work is in fact the definition of bioweapon. You take a thing that does exist. You amplify its harm to humans. That's a weapon. You know, we could call a gun a copper accelerant because technically that would be true, right? You know, it accelerates copper. It turns out that it's a gun. We need to start calling things what they are right? And if we're, if we're playing the game of saying somehow or another. Well, the the public is offended when you say bioweapon. Well, I got an idea, don't make a bioweapon and I won't call it that. But let's get precise what is being injected into people. Unlike any other immuno stimulatory exercise ever, what is being injected into people is the recipe to make the weapon in your body. The M. R. N. A. Is actually telling your body to make a spike protein associated with the model of coronavirus. In other words you're not getting immune. Your body is

being turned into a weapons factory. You make the weapon and you hope that your body defends against the weapon. You told your body to make, see what I just described is what M. RNA does. But if we told people that you know what they wouldn't do they wouldn't line their kids up at stadiums to get shot and they wouldn't line their Grammys and grandpas and they wouldn't line their moms and dads and they certainly wouldn't line their Children up to get shot because they're not being told the truth. This is a weapon. It is a bioweapons instruction to make your body make the spike protein which harms you. And then you hope having made the weapon in your body that your body defends against it. It is ludicrous, it is gene therapy. It was defined as such in every sec filing by Moderna and biontech every filing they ever made said this is gene therapy and craig if I told you to take prophylactic chemotherapy for the cancer you might have. You'd go hey dave. That's nuts. I'm not going to do it. Well guess what? Taking prophylactic gene therapy for a pathogen that doesn't exist to get a disease that was having to be invented as a combination of symptoms. It's not even a disease. Well none of that makes sense even. Mm hmm. Yeah. Look I mean it's frightening just hearing the way you explain that and just you know some people don't even understand the concept of what MRNA technology is but this is the first ever into a human body. Do you want to do? Well. So so there's no way that this would have been accepted if you guys remember. And and listen in Australia remember dolly the sheep. This was when a bunch of scientists tried to invent a way to clone a sheep and it bounced all over the place. Australia had a hit on it. Um U. K. Had a hit on it. The U. S. Had a hit on it. Singapore had a hit on it. But back then churches lost their mind. People shouldn't play God. And and and society said oh no no no we don't want Frankenstein labs to be crawling around and all that kinda stuff. So we had a public outcry that said don't do it. And since then they've never been able to pull it off. And then Anthony Fauci figured out If you invent the illusion of a disease. And he said it remember this is the Peter dash quote in 2016 he said we're going to make a pathogen to create a hype that the media will run with so that the public accepts the vaccine. People. This is not me accusing somebody. This is me reading their own writing their own words. And and we're being told listen, I got to meet Hunt. You know your your health minister when I was in victoria. Let's just say I didn't play nicely with the government of victoria's. In fact, the last thing I did in victoria was sue the government in the Supreme Court of victoria. So I don't think they were minding when they saw the door hit my butt on the way out. But but the fact of the matter is I was uncovering corruption in victoria and I was uncovering corruption and by the way, I have memos dan andrews would love to never see the light of day. And the bad news is they will see the light of day because here's the problem. The problem is when corrupt people manipulate to coercive population into doing something that they would not otherwise do. That is a crime that's not just bad behavior. That's a crime and we have to make it abundantly clear that those criminals must be held accountable. Yeah. And just for the I guess for the audience we you know there's 30 plus years of evidence here that you've uncovered through patents through everything. But from event to 01 how did we get like we've basically had this simulation and then something happened in January where they brought out a test and then they put it onto the world. But they use this emergency use to bring in this experimental thing. Can you want to explain that in logical terms? So people understand exactly the step by step process here. Well so we have for the first time in human history allegedly a disease that we can't diagnose in in all of human history. We've we've never had this we've never had a disease that is only indicative of a committee that makes a set of symptoms the designation of a disease. So this is bizarre. But it turns out that if we were measuring for a virus, which we can do, by the way, there's things called Eliza essays. There's all kinds of other essays that you

can do as a matter of fact, years earlier, Anthony Fauci said that coronavirus wasn't optimally suited for diagnosis with RT PCR. So the crazy thing is he started trying to file patents on other ways to diagnose coronavirus. He was the critic of it. He was the one that said it wasn't a good idea. And then mysteriously we have to make up a bizarre thing. Now listen, I used this analogy before, but it's the best way to explain this to the general population. Let's say I get a piece of dust from your living room. Sorry I'm speaking to Australians from your lounge room. Okay so from your lounge room I get a piece of dust. Now you have a dog, you have a sofa and you have a carpet. Right? Keep it simple and there's a piece of dust. What are T. P. C. Two R. Does is it takes a piece of dust and it makes a whole bunch of copies of and by making a whole bunch of copies it amplifies it. And before long you start saying oh it's it's starting to look like fluffy fluffy stuff. And then you go, well that could be a dog hair. That could be a piece of furniture. It could be from the carpet. So we amplify it more and then before long you go, well it's not looking dog ish. So we're gonna rule out dog. But I still can't tell whether it came from the carpet or the lounge. And then we keep amplifying it. We go, well I'm seeing a little bit of what looks like maybe a finer fiber. So I'm going to guess that that came from the couch, that's what R. T. PcR does. Okay. The best you ever get is a hunch that you think it probably came from the thing. Because the problem with RT PcR is it only amplifies a fragment. So by figuring out that it's probably a piece of furniture, you can't tell it's a piece of furniture. You can probably guess with a high degree of confidence. It's not your dog. That's as good as it gets. That is the standard that is currently being used to say you're sick. Mhm. Like that's the dumbest thing you could possibly do because it doesn't tell you you're sick. And by the way, that's the reason why so many people who have a test that comes back positive have no symptoms and the bad news for all of these criminal conspirators. Is that a lot of people get sick who don't have any of the RT PcR So the bummer is they tried to tell a story. The lie was self evident. So all they did was they doubled down on the lie. And it's like a little kid think about this little kid gets an oreo cookie puts in his mouth before dinner time, he wasn't supposed to have a cookie. So you see crumbs all over his face and what does the little kid do? Did you eat a cookie? He goes, no, well what's the crumbs? They're not crumbs right. They make up worse lies to cover the lie. That just went before. Well that's because when you are in fact coercing a population, you increase the frequency and the amplitude of the lie so that the public doesn't have time to think what planned emmick did. Number one is it woke people up? What pandemic two did was it gave people the opportunity to sit for an hour and go, man, there's a lot to think about and the cool thing is when you slow your brain down and you just listen to the speed of consciousness. You don't fall for the lie. Mhm. Yeah. And I mean from the pcr like to be able to bring in this experimental injection, they used you know like the three letter words like the CDC the FDA is the and they are able to bring through this injection through an emergency use back door. Do you want to explain how they could do that because there were genuine treatments available? Oh yeah. And and that's one of the tragedies. Um The NIH had funded research back when we first had stars and then again when we had mirrors Um which was the Middle Eastern respiratory syndrome that came out in 2013. Um when we when we looked at both of those outbreaks, we actually established that hydroxychloroguine was effective about treating, sorry. And that's NIH Zone studies. And by the way, let's get something clear. Johns Hopkins University. The university named after johns Hopkins is named because of hydroxychloroquine. Johns Hopkins University was the university that was in fact largely in the school of Public Health, developed for malaria treatment. And the primary malaria treatment was hydroxychloroquine. I don't see johns Hopkins University taking his name off the building because apparently the thing that actually did you get used to treat malaria

somehow is now dangerous because it never was dangerous when used appropriately. It always worked. But let's I got myself distracted there. But that's an important point. So so Emergency use authorization requires number one an emergency. We didn't have one. We made it up As a matter of fact on January 29 Alex is are the Department of Health and Human Services Secretary in the United States actually said there is no basis for an emergency. And then two days later he signed an emergency use authorization with no new data. None If there's no new data between 29 January and 31 January, then there's an interesting question who got in his ear? Well it turns out that we don't have to ask the question because Alex is our when he was at eli lilly, which is the company he was working for before he came to the trump administration, Alex Azar was already under investigation for price fixing and criminal collusion in Mexico on tripling the price of insulin to Mexico. He was already under investigation for a crime. So if you were going to have somebody run a criminal racket, do you think it would be a good idea to get somebody who's already running a criminal racket? Which then by the way was found to have been in fact a criminal racket? Wouldn't it be convenient to get somebody who knows how to run a criminal racket? As the criminal racket sounds pretty good. Here's where it gets interesting on the 31st of january when we signed that emergency use authorization, we knew that we had to do something that is anti competitive and in the U. S. Violation of antitrust laws, we had to suppress all the alternatives so that we could say in april that the only way out is a vaccine. And listen when the Prime Minister of Australia, when when the Prime Minister of Canada when the President of the United States, when the Chancellor of Germany all get on stage and I'll say the only way to normal is through a vaccine. Like they were reading from a teleprompter because they were if if that was a true statement then unfortunately we wouldn't have had to make up the lie of suppressing all the other alternatives. We let humanity die seriously across the world, hundreds of thousands of people died from a treatable condition because we wanted to get to M. R. N. A. That's what was that's what they were after they said it and the emergency use authorization was to get all of the traditional parties who would have blocked it. And most notably, let me tell you, the most notable one was the catholic church because no one was more outspoken against the modification of the human genome in the catholic church. But when the pope comes along and says God gave us a vaccine, hmm, guess what you want. You won the battle and the war because now the church no longer has a moral standing on saying that any genetic modification of human life is is wrong because they've already said it was acceptable. So that's that's the big E. U. A sorry emergency use authorization. That's the big E. U. A. When the Big Win was it actually essentially neutered the church's objective to morality around modifying the human genome And that we're not even talking about. Because when we understand the implications of that genetically modifying humans now no longer has its historically biggest opponent which was a church and we chopped the church off at its knees. And now it is kneeling at the throne. A vaccine. Hmm. Well and um yeah like some of these organizations that I mentioned there like you've got the world economic forum and many of these three letter things you know when they're marketing slogan is you own nothing and be happy. You know you have to be frightened about what we're looking at in the future. So do you want to just touch on any of that? Well, you know I I gave a couple of speeches years ago in fact one in Melbourne uh probably around 2017 where where I commented on the fact that Stephen Hawking and Elon musk used to get up and and talk about how we should all be afraid of Ai right? Be very afraid of Ai and what I tried to share with people then was listen to who's saying be afraid Right? You have two people who do not have a very social you know gregarious personality. You have to people who think technology saves everything. You have two people who don't have a beautiful picture of what

humans are and they're projecting their version of humanity onto a machine and go, that would be scary. And that's true. If you're a relatively miserable human being and you imagine a machine that's relatively miserable, That's a bad picture. That's a dystopian future. And what I said, two people then and I say it to them now is the conversation we should be having is what kind of humanity do we want? Because the fact of the matter is if you are in the world economic forum right now, you want a servile class, You want an acquiescent population. You want people who follow orders. You want robots, that's what you want. You want to reduce the human experience two functional robots, You tell them to do something, they follow the rules, you tell them to do two mile radius of exercise or 500 m exercise or whatever else. They just do what you tell them to do. Well, here's the problem. That form of humanity is not human. That's a mechanical view of humanity. And what I'm saying is we now you and I craig right now we have an opportunity to help redefine and reclaim the beauty of a noncompliant humanity. I mean, I come from a long, long, long line going back to the 16th and 17th century. Um I come from a long line of heritage. Many of my ancestors burned at the stake drown in the river, all kinds of other things because we knew that sometimes standing for something was better than kneeling for everything. And guess what? It's still the case today. Standing for something is always better than kneeling for anything. And so for me it's really simple. We have to model the beauty, the elegance and the wonder of what it means to be fully human and let everybody else make us the envy of the world. Because even robots look at the free and the liberty and humanity and go I wish I could do that. That's our job. Yeah. And you mentioned you've been on this journey as probably the most outspoken pulling apart this whole story, but recently you did a lecture and you said today is the last day you'll hear me being mr nice guy. And you come out and said the gloves are off, you know this is what it is I'm calling, this is a criminal conspiracy. And you named a whole heap of people. And do you want to just touch on that? You know, you've got the protected species dr Fauci but like do you want to touch on that? Yeah. Well listen I think I think one of the things that was fascinating is that and I'm going to get really critical here. I told you I wasn't gonna be nice. So let's get nice. Let's not get nice. Um We have a problem. And by we I mean people who have good hearts have a problem. We refer to they as this kind of anonymous other. Oh, they're doing this and they're doing that and they this and they that and and here's the problem craig. When we provide anonymous power to an anonymous figure, we're actually feeding their ego the minute we actually call them people like Larry Fink at Blackrock, like yo yo ma! And you heard me right, Yo yo ma the cellist. And people go, hold on a second, what does he have to do with it? Do you realize how cunning the use of acoustic frequencies is in mind control? Do you think there's a reason why every church has always had chance? Every child has been taught nursery rhymes by singing them. You know, once the jobless Wagman said Bong, do the shade of a Google. Great, why do we do that? Because guess what? I probably heard that when I was four and I still can sing it right now at 54, we do that to program our brains. So we have a whole raft of people and by naming them by names. And then by understanding what was their role in the story. We bring down the ego IQ energy that is fed by the anonymous because once we know that they are people too, two things are possible. Number one, we can hold them accountable, but number two, we can access empathy. We can actually see that maybe these are broken people. Maybe these are people who are in pain. Maybe these are people who actually have an experience of life that's been terrible and they're getting even for the bullying when they were a kid or the sexual abuse that they had or whatever else. We can actually access empathy for bad people and that's an important trait of humanity. We still have to maintain the sense of justice and accountability but have the humility to accept the possibility that

these are broken human beings in need of love and repair. This is not just some sort of anonymous day controlled by some sort of anonymous deep force from the middle of some dark galaxy and I'm not saying those things don't exist. I'm not belittling it. I'm just saying we need to make sure that if we, the people want to stand up, we need to realize That less than 50 people, our architect in this, which means less than 50 of us need to get together to actually meet that battlefield and win. See sometimes I think we get caught by saying they, we think it's this massive, massive ist of thousands of people all who have dark lords emblazoned on their shoulders. Well there are a couple of those, but most of the people Are in fact people who put their pants on one leg at a time, They put their shoes on one ft at a time. They don't levitate into their pants. They don't levitate into their shoes. And we need to see them as approachable human beings. Because by doing that, the problem becomes a scale we can address. Mm hmm. Yeah. And I guess um one of the people or a couple of the people in that 50 would be one of their mechanisms that they've been able to continue with their agenda is their ability to use the tools like the internet to censor people like you and you know, and continue on with a one sided narratives. So they continue to say we trust the experts, well who are the experts who are these people to be Um scrutinized and it's 90, it's still 95% safe and effective. -- Like -- Yeah, well, you know, it's funny Dustin Moskowitz the name I like to pick on um the co founder of facebook with with um you know, the hoodie in chief. Um you know, everybody thinks Zuckerberg is the guy, but Dustin Moskowitz is the guy who is actually pulling all the strings on this craziness and and he's one of the early billionaires that you've never heard of. But if you look at Dustin Moskowitz and you look at what he did, he actually had a twofer in this deal. He wanted to actually get the emergency, use authorization going, which is part of the agenda. But he also has an investment in Sherlock Biosciences, which is the CRISPR technology which is the gene editing that will be required to save you from the shots that you've just taken. So the cool thing is he made an environment in which you can say look over there, it's all about MRNA. Well he knows that what he's really doing is setting the stage for a permanent dependency on CRISPR technology to gene edit out the nonsense that they put in a brilliant strategy. And by the way, the only way you can pull that off is to make sure nobody like me gets a big voice because a person like me gets a big voice, then I've created a problem for his crazy plan. So what I did in my speech in red pill expo in Lafayette Louisiana because that reminded people that he, he spends a lot of money to clean his reputation. And by the way, all those guys, the funny thing about that is that um, there's a tiny problem. Every time I say his name, Dustin Moskowitz, it costs him another two million bucks or a million two or whatever it is to go pay somebody to get rid of me mentioning his name. So I mentioned it again. Dustin Moskowitz. There it is. Now we're at 2.4 million. And if I said it again, Dustin Moskovitz were now 3.6 million that he's going to have to pay to get rid of it. And I figure if we all say his name often enough, we all type it into enough browsers, we can actually drain all of his wealth if we wanted to. But but in all seriousness, here's, here's the thing, we need to understand that while we were being shut down, while we were being censored, our voices actually grew. Do you know how many people around the world now reach out to me on a daily basis to say, hey, thanks very much. Our community is not falling for the injection because of your work like all around the world and the coolest thing about it is the more they try to shut me down, the louder my voice gets. And so the irony is, here's what they missed. They missed that you would reach out to mickey, mickey would reach out to me, we would build a network and what we've done is Guerilla Warfare, right? We, we've just gone, okay, that's cool. You shut this down, will amplify it by tenfold. And the fact of the matter is Greg, this is the best time to be alive. We are part of the founding of what's next and I love the people, I love the thoughtfulness, I love the communication and most of all As Mickey is doing in pandemic three, the film that's upcoming, what I love is that we're all passionate about solutions were not just diagnosing problems, we are about saying, hey, how do we, the people step into taking responsibility for where we failed to hold people accountable, but how do we start modeling a life that becomes the envy to which everyone else aspires and that is my mentor. So just in, in that point there where we, I do want to talk a bit about this just um next writing the next chapter, um you know this you mentioned, living through this time is in somewhat of a beautiful experience, It's the ultimate soul test. I was actually having dinner last night with four couples that we've really met through this journey and we've been alienated from society. So we created our own fitness club and now we're having dinners together and um yeah, do you want to just touch on? Um, you know, living through this time? Well, I kind of say that I think we all showed up to be exactly here exactly now. Um the level of intimate friendships that have come throughout this period where you don't have to cut through the bs, you're, you're, you're either, you know, engaged and connected or you're not and you're not messing around. Um I love the no nonsense relationships, friendships and beauty that's coming in this moment. And the fact is that that the quality of experience where depth of soul searching, depth of humility, depth of intimacy is happening at a scale that I've never seen before in my life and I think we're here because all of the vulnerability of the system that required us to maintain illusions has fallen away and now we have the ability to stand naked in front of each other going, hey, you know what I am, who I am, you like it great, you don't like it, move on, we are going to value the connections that we have and I absolutely love it. This is the best time to be alive. It's a fabulous, fabulous time to be alive because we, the people have a chance to finally move away from illusion, living and get into reality, living best time to be alive. Mhm And just when people say spiritual game, good versus evil. Light versus dark, what what's your definition of that? So so it's very simple. I think we all have a light within us. I think light only wins when we let that light shine. This is not some sort of metaphysical out there. This is about are you ready to access the thing that's inside of you that says that, you know what truth is? You know what integrity is, You know what intimacy and connection are, you know what fellowship is, You know what that is. And if we light that which is within us, the light winds and if we allow that to be hidden and crushed then the darkness winds thomas jefferson very famously said in a quote and I love this one. He who lights his taper at mine receives light without darkening me. What a beautiful metaphor as I become more of my essence, which is an emitter of light. Then I get next to somebody else and they become an emitter of light. Our job is to light the galaxy of humanity and make it shine so that no one ever loses that north star, that pole star that allows us to figure out our way home. Mhm. And just always say to people, everyone has a role to play. We have this hero's journey. Um you're doing what you're doing. I'm doing what I'm doing. What would you say for the hero's journey? For everyone? Just to say, hey, we all need to do our bit, whether it's contribution through fundraising, -whether it's sharing information, what would you -- say? Well, I hope that we get rid of joseph Campbell's power myth and the hero's journey at the end of this thing. Because what I want to know is I want to know that we stood together, we conquered this together, we brought the resources that each one of us had together and at the end nobody gets the credit. We can't even find the hero because the we the people stood together, we the people took action. We the people brought our best to the table and there will not be any fingerprint of the hero because we'll all have our arms around each other hugging and nobody's going to get the point to go up. It was me. We get to redefine what a hero is and a hero is a person who does not let the darkness prevail, lets light come out, but craig man, thank you so much. Thank you for

what you're doing. Thank you for all of the reach that you've built. Thank you for your voice. Thank you for your kindness and thank you for being the echo of an Australian accent. As you know, my dear wife kim who is from Sydney and you know, we live together in Australia for several years. We have a beautiful community of friends. Thank you for being the echo for us of our lovely, beautiful home where that gorgeous southern hemisphere comes crashing into the great Southern Ocean. Thank you. Thank you David. -- And um just mention your website so people can reach out to you -- and yeah, the best place to find our stuff is at fully live Academy dot com or you can find the craziness that I do at David martin dot world. On that note, we'll wrap up the interview and I want to thank you again. You have your inspiration to the world and keep doing what you're doing and will continue to tune in and listen and follow and share everything you're doing. You're most welcome Greg. Thank you. This is not a time for us to go in a mob frenzy. Find the perpetrators and haul them into the town square and pillory them. This is a moment for us to recognize that every decision that is being made today by any of the conspiring parties. Made perfect sense in each increment when each one of those decisions was made. The some of those incremental steps has lead to devastation because they lost touch with their fellow humanity. But that's an invitation for each one of us to examine how we're living and how not a single decision we make. Not one in any moment is without consequence. This is our moment to reclaim our humanity. Mm hmm hmm hmm hmm hmm hmm. Our lives are shaped and guided by stories. The stories were told become the stories we tell. The more we hear them, the more we believe them when used as a tool to help us to better understand who we are, where we came from and where we're going when used as a weapon, they can be deadly. Yeah. one of the most dangerous stories we've been told is the one that goes something like this humanity is a failed experiment. We are parasites, cancer, a virus. Human beings are a disease. It is a myth that permeates our movies, our music, our media and our minds as they say, repeat a lie after enough. It becomes truth. Yes. Mhm mm hmm. Yeah, perhaps that was the goal of the authors of that story. -- Um -- we feel too -- afraid to have -- kids because we feel that we're heading towards civilization breakdown fear, shuts down the part of our brain designed to solve problems without that ability. We look for others to guide and save us. In doing so we lose touch with our most primal nature. We forget that we are an extension of the most brilliant and resilient ecosystem in the universe. We stop eating food grown from the earth and began consuming products processed from machines. We trade medicines that heal for drugs that harm. We abandon love and liberty for det independency. The good news is our story is not over. The climax has yet to come that moment when the hero rises from defeat summoning a force they forgot they had a force within a force of nature. Yeah. A new generation of americans think about the future generations. Mhm Yeah. Mm hmm, mm hmm. Yeah. Mm hmm, mm hmm, mm hmm. Yeah. Okay.
